Anh Minh (Eric) Hoang

23minh.ha@vinuni.edu.vn | Hanoi, Vietnam

Research in LLM safety and alignment, focused on detecting attempts to bypass safeguards and understanding how compromised training data changes model behavior.

Research Manuscripts

SafePrompt: Jailbreak Search Defense through Activation Signatures

Anh Minh Hoang | 2026 | ACL ARR, October 2026 cycle · Under review

- Designed a filter that detects attempts to bypass a language model's safety rules by examining patterns in a separate model's internal activity.
- Across two models, reduced the success of an automated attack from 91–92% to 14–17% after 90 attempts per goal; blocked 2.53% of 750 legitimate requests. Evaluated repeated attacks, attacker feedback, and the cost of rejecting valid requests.

Latent-Target Poisoning: Discovering Attack Populations in Coding Assistants

Anh Minh Hoang | 2026 | ACL ARR, October 2026 cycle · Under review

- Investigated how tampered training examples can teach coding assistants to insert unwanted code into answers to ordinary requests, without adding a trigger to the user's prompt.
- Built controlled experiments across two model families and two coding datasets, comparing four ways of selecting affected requests. Measured unwanted-code generation, effects on other requests, and performance on standard coding tasks.

CSR: Physically conditioned scale-transfer super-resolution across optical missions

Minh A. Hoang and Nidal Kamel | 2026 | Under review at ISPRS Journal of Photogrammetry and Remote Sensing

- Developed a model that improves the spatial detail of satellite images from different sensors, using wavelength and pixel-size information instead of a separate model for each sensor.
- Achieved the largest mean structural improvement among compared methods on all four 4× OpenSR benchmark suites. Tested adaptation to new satellite data, including 174 held-out PROBA-V scenes.

Research Experience

Center for Environmental Intelligence, VinUniversity

Research Assistant *June 2026 – Present*

- Built satellite-image training and evaluation pipelines in PyTorch Lightning and Hydra for Sentinel-2, Landsat 8/9, NAIP, and VENµS, using data accessed through Planetary Computer STAC.

Education

VinUniversity

BSc in Computer Science, in progress | Hanoi, Vietnam

Selected Honors

2025 | Regional winner, RMIT AI Hackathon; highest AU-ROC model among 400+ teams.

2025 | Top 13 among 100+ university teams, 1st Vietnamese National Collegiate AI Olympiad (OLPAI).

Skills

Research: Language-model safety evaluation, model representations, training-data security, controlled experiments.

Tools: Python, PyTorch, PyTorch Lightning, Hydra, Hugging Face Transformers, LoRA/PEFT.

English: IELTS 8.5 overall (Listening 9.0, Reading 9.0, Speaking 8.0, Writing 7.0).
